ABSTRACT OF THE DISCLOSURE

Information handling system consumable orders, such as orders for printer
supplies, are placed through a network, such as the Internet, by automatically
monitoring consumable quantity to detect a consumable order trigger event for
15 presentation at the information handling system. User initiated selection of a
consumable order communicates order information to a consumable order server,
which pre-populates a completed order form for display at the information handling
system, such as an order form with consumable information, payment information and
delivery information. For instance, the consumable order server is associated with the
20 manufacturer of the information handling system and applies the payment and
delivery information from the purchase of the information handling system to
complete the order form so that a user need only confirm the accuracy of the
completed order form to place the consumable order.
